Installation

The Cold Air Distribution kit is provided along with your Cabinet Panel Cooler to direct the cold air to any hot spots within your cabinet enclosure. Holes may be cut or drilled in the tubing. Use at least eight (8) 3/16" diameter holes in the tubing to minimize any back pressure on the cooling unit.

The aluminum clips /w self adhesive tape are used to hold the hose in place as you direct the cold airflow throughout your cabinet enclosure. The end of the hose is typically plugged off.

Troubleshooting & Maintenance

There are many factors that can cause the reduction in flow or force. Undersized airlines, restrictive fittings, clogged filter elements, and number/size of holes in distribution kit are common areas to check. If you suspect below average performance, install a pressure gage at the inlet of the Cabinet Panel Cooler.

*** For replacement or repair filter and regulator parts, contact STREAMTEK™ at +1(705)770-4455 or sales@stream-tek.com.*
